Submitted (MAR-1996) to the PDB data bank.

-i- FUNCTION: THIS ENZYME CATALYZES CARBOXYPEDTIDATION AND
TRANSPEPTIDATION REACTIONS INVOLVED IN MACTERIAL CELL WALL
METABOLISM. IT EFFECTIVELY CATALYZES THE TRANSFER OF THE N-ALPHA,
N-EPSILON-DIACETYL-L-LYSYL-D-ALANYL ELECTROPHILIC GROUP OF THE
STANDARD TRIPEPTIDE SUBSTRATE N-ALPHA, N-EPSILON-DIACETYL-L-LYSYL-
D-ALANYL-D-ALANINE TO MATER. IT ALSO PERFORMS A WEAK BETA-
LACTAMASE ACTIVITY, HYDROLYSING PENICILLIN INTO PENICILLOATE AT A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   METAL

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               primer: -40RP from Gibco.
Williams' plants that were greenhouse grown. The The CDNA library was prepared using the Stratagene phluescript II SK(+) library construction kit. First strand synthesis was performed with 5-methyl dCTP, hence the ligated cDNA was hem.methylated. A modification of Stratagene's first-strand synthesis primer was used. An 'anchor' nucleotide (v-A, C, or G) was added to the 3' end of the primer (GACAGACAGACAGACACTACTCTCGAC(T)18V) to anchor the primer at the 5' end of the poly(A) tract. After second-strand synthesis, the cDNA ends were filled in with cloned Pfu DNA polymerase and size-fractionated with a 400 bp cutoff, using a SizeSep 400 Spun column from Pharmacia. The column eluent was ligated to ECORI adaptors and phosphporylated. The XhoI sites in the cDNA would be protected by their hemimethylated status. The cDNA constructs were size-fractionated with a 500 bp cutoff, using GibcoBRL Life Technologies' cDNA Size Predigested
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           [1] ;, mRNA sequence.

Both the white and blue colonies appear to contain recombinant plasmids with cDNA inserts, based on size (n=56) and sequence (n=16). This library was constructed by Dr. Paul Keim and Dr. Virginia Colvery.

                                                                                                                                                                                                                    0
                                                                                                                                                                                                                                   mid-log phase in TAP (acetate-containing) medium in the light, TAP medium in the dark, HS (minimal) medium in ambient levels of CO2 and HS medium billed with 5% CO2. PolyA mRNA was purified from each sample, pooled and cDNA synthesized. The cDNA was directionally cloned into lambda ZAP II (Stratagene) in the EcoRI (5') and XhOI (3') sites. PBluescript II SK- plasmids were excised from the lambda ZAP clones by superinfection with ExAssist (Stratagene) phage. The library was normalized using method 4 described in Bonaldo et al (1996) Genome Research 6: 791-806."
